

24F MPO Method B Test Assembly

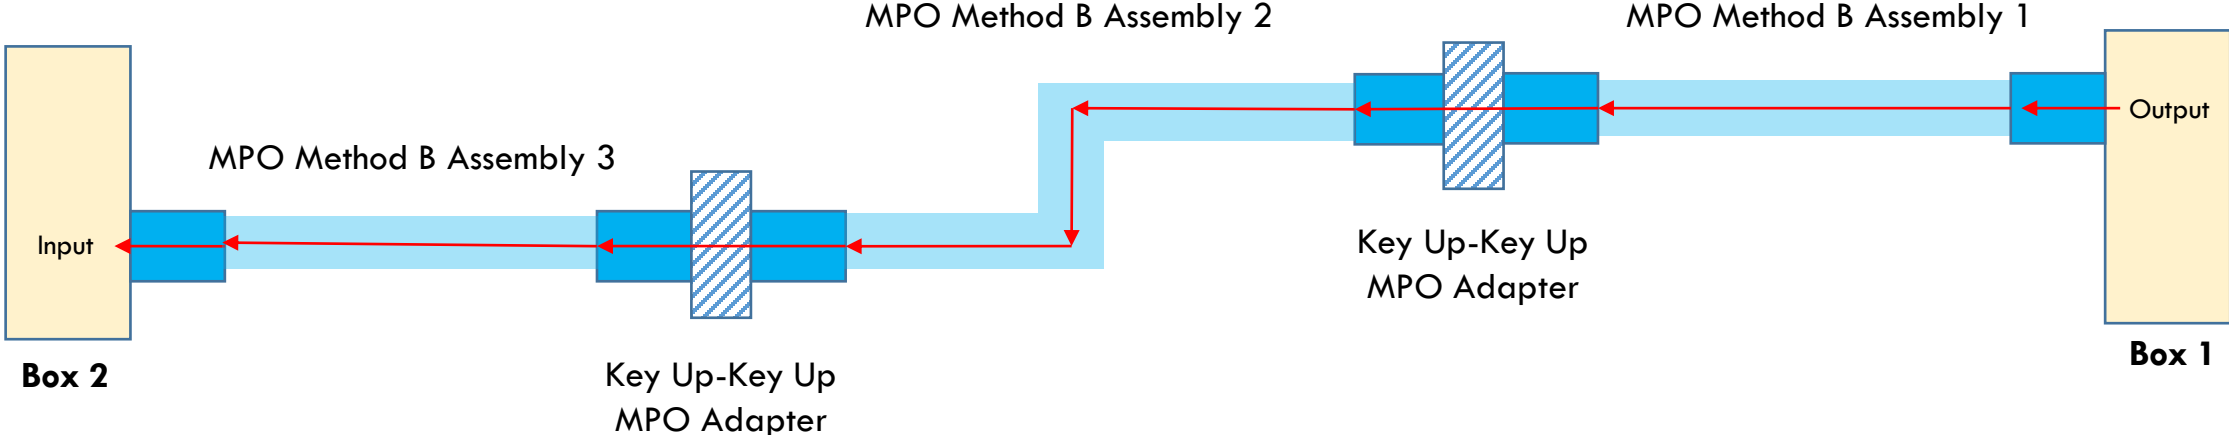

SMART CHECKER MPO

- The test box has 12 independent light sources to a 12F MPO (pinned) in the Output port.
 - The light sources can be set to continuous, pulse or scanning. When the tester is used for a polarity check, it is in scan mode.
- The input port receives the incoming signal to determine the polarity.
 - If we need to check the polarity of a 24F MPO assembly, we can use two Y test cables and MPO Key Up to Key Up adapters for verifying the 24F MPO link polarity,

8F and 12F MPO Method B Testing
